Automated* Transcription of a Lyric's Melody

(*if you've done a lot of preliminary manual work)

David Branner

In September I reported on an experiment to transcribe the solo singing voice with automated tools.

In September I reported on an experiment to transcribe the solo singing voice with automated tools.

I have recordings that I want to study – specifically, I want to study how the melody reflects the organization of the words that the music is set to.

In September I reported on an experiment to transcribe the solo singing voice with automated tools.

I have recordings that I want to study – specifically, I want to study how the melody reflects the organization of the words that the music is set to.

I want the text, annotated with its melody. A normal musical transcription supplies the opposite of that: a melody annotated with words.

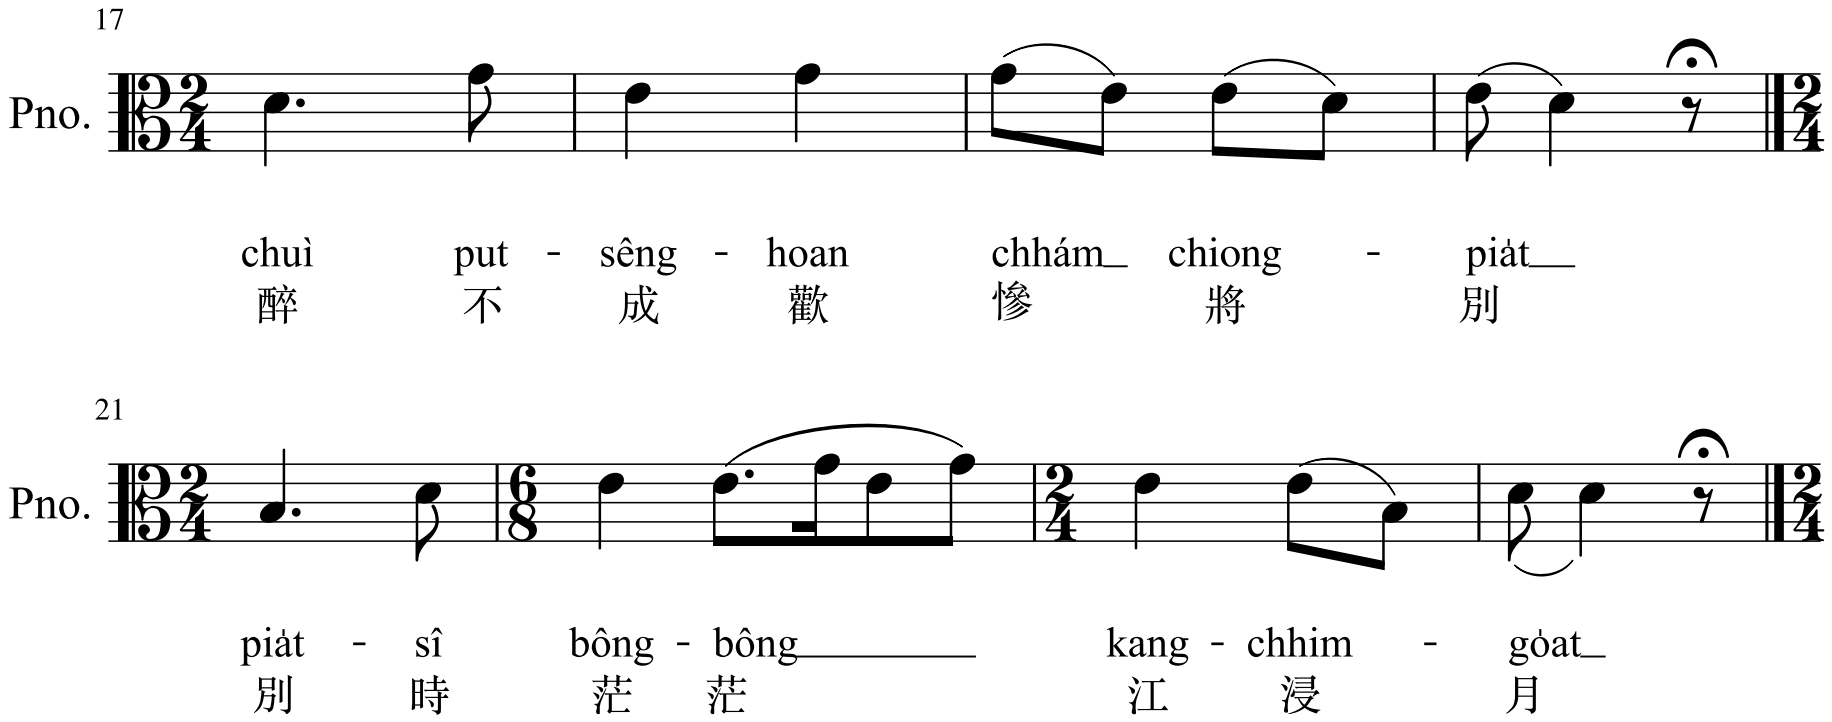
My earlier transcription (audio => MIDI => Python editing) went very badly because of tremolo in the singer's voice and reverberation in the recording.

My earlier transcription (audio => MIDI => Python editing) went very badly because of tremolo in the singer's voice and reverberation in the recording.

In the end I transcribed the piece by hand, using an open-source program called MuseScore.

My earlier transcription (audio => MIDI => Python editing) went very badly because of tremolo in the singer's voice and reverberation in the recording.

In the end I transcribed the piece by hand, using an open-source program called MuseScore. Example:



Initially I was pleased because MuseScore can play back the melody I transcribe, speeding the work.

Initially I was pleased because MuseScore can play back the melody I transcribe, speeding the work.

But I was in luck because it can also export the score to an open-source format called MusicXML.

Initially I was pleased because MuseScore can play back the melody I transcribe, speeding the work.

But I was in luck because it can also export the score to an open-source format called MusicXML.

This turned out to allow me to do exactly what I had originally wanted – to study the melody of each syllable, quantitatively.

Here is a single note of the 1100-odd note performance I transcribed (the text is Taiwanese in Church *romaji*):

Here is a single note of the 1100-odd note performance I transcribed (the text is Taiwanese in Church *romaji*):

chuì
醉

Here is a single note of the 1100-odd note performance I transcribed (the text is Taiwanese in Church *romaji*):

chuì
醉

and here is the XML for that note:

    </note>
```

That’s exactly what I need to turn

That’s exactly what I need to turn
words set to music (traditional score-notation)

That’s exactly what I need to turn

words set to music (traditional score-notation)

into

That's exactly what I need to turn

words set to music (traditional score-notation)

into

melody on each syllable.

That's exactly what I need to turn

words set to music (traditional score-notation)

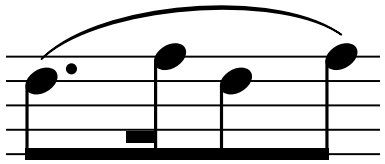
into

melody on each syllable.

The point is to have a representation of the melody organized by words, rather than the other way around.

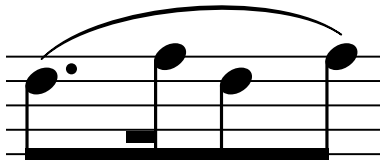
Another example:

Another example:



bông_____
茫

Another example:



bông
茫

```

    </notations>
  </note>
```

It is easy to parse the XML using the `lxml` library; `lxml`'s `root.xpath` method allows me request all the `note` elements as a generator, and I can step through the generator's output, identifying syllables and then retrieving the melody to assigned to those syllables.

It is easy to parse the XML using the `lxml` library; `lxml`'s `root.xpath` method allows me request all the `note` elements as a generator, and I can step through the generator's output, identifying syllables and then retrieving the melody to assigned to those syllables.

Important edge cases:

Important edge cases:

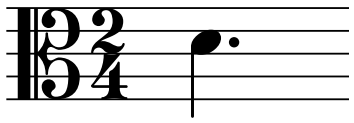
1. rests — since they don't correspond to syllables, consecutive rests can be collapsed into one;
2. notes tied (but not slurred) together — since they correspond to one or part of one syllable and are all the same pitch, they can be collapsed into one;
3. melisma — more than one note per vowel or syllable — represented as a series of notes on one syllable.

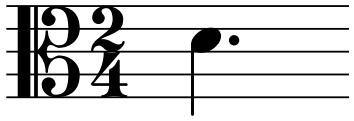
Output of the first note above:

Output of the first note above:



chuì
醉

Output of the first note above:

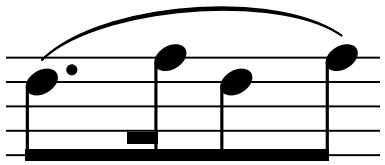


chuì
醉

```
...
('chuì',
  [{'pitch_data': {'octave': '4', 'step': 'D'},
    'lyric_2': {'syllabic': 'single', 'text': '醉'},
    'duration': 12}]),
...
```

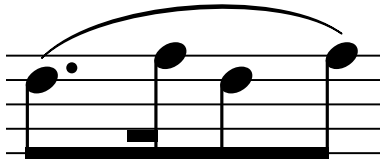
Output of the more melismatic second example above:

Output of the more melismatic second example above:



bông_____
芷

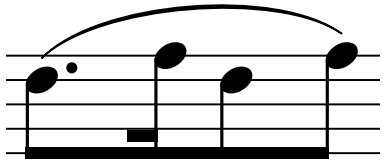
Output of the more melismatic second example above:



bông_____
茫

```
...
('bông',
  [{'pitch_data': {'octave': '4', 'step': 'E'},
    'lyric_2': {'syllabic': 'single', 'text': '茫'},
    'duration': 6},
   {'pitch_data': {'octave': '4', 'step': 'G'}, 'duration': 2},
   {'pitch_data': {'octave': '4', 'step': 'E'}, 'duration': 4},
   {'pitch_data': {'octave': '4', 'step': 'G'}, 'duration': 4}]),
...
```

Output of the more melismatic second example above:



bông_____
茫

```
...
('bông',
  [{'pitch_data': {'octave': '4', 'step': 'E'},
    'lyric_2': {'syllabic': 'single', 'text': '茫'},
    'duration': 6},
   {'pitch_data': {'octave': '4', 'step': 'G'}, 'duration': 2},
   {'pitch_data': {'octave': '4', 'step': 'E'}, 'duration': 4},
   {'pitch_data': {'octave': '4', 'step': 'G'}, 'duration': 4}]),
...
```

Final output is list of tuples: [(syllable, [note-dicts]), ...].

End
